Practica 3 Thread

Nombre: Sergio Bereño Veron

Nombre: Jonatan Valle Corrales

MAIN.class

}

```
package thread;
import java.util.Scanner;
public class Main {
      public static void main(String[] args) {
             Scanner <u>sc</u> = new Scanner(System.in);
             ThreadEx3 tex3 = new ThreadEx3();
             Thread t = new Thread(tex3);
             t.setDaemon(true);
             t.start();
             System.out.println("Ordenando...");
             sc.next();
      }
}
THREAD.class
package thread;
import java.io.IOException;
public class ThreadEx3 implements Runnable {
      @Override
      public void run() {
             try {
                    Process proceso = Runtime.getRuntime().exec("cmd /c sort
lista.txt > orden.txt");
             } catch (IOException e) {
                    e.printStackTrace();
      }
```

Aquí vemos que no hay ningún text llamado order.txt

Aquí vemos como al darle al Run no se genera el archivo order.txt hasta que no le damos a una tecla.

```

Edit
```

Ya tenemos el order.txt con los números ordendos.

Hay muchísimos números repetidos ya que hay 1 millon 700 mil líneas
